

# Project Status Summary for Replit

---

**To:** Replit Team **From:** Manus AI **Date:** February 26, 2026 **Subject:** Plain-English Summary of the Faith Empire iOS App Submission

---

This document explains the work completed to get the **Decoded Faith Empire** iOS app (version 1.1.0) ready for the Apple App Store and clarifies the final step that is currently in progress.

## What is EAS?

First, a quick note on **EAS (Expo Application Services)**. You mentioned you haven't heard of it. In simple terms, EAS is a set of tools from the creators of Expo that automates the most difficult parts of building and submitting an app. Instead of needing a Mac with Xcode to build the app and the Transporter app to upload it, EAS does all of this in the cloud. It's a huge time-saver, but like any service, it can sometimes have its own quirks.

## What Has Been Done: The Fix

The main challenge was a simple but critical mix-up with the app's identity.

1. **Two Apps, One Name:** There were two separate app listings in your App Store Connect account: one named "Decoded Faith Empire" (which was fully set up with screenshots, descriptions, etc.) and another named "Faith Empire" (which was a mostly empty placeholder).
2. **Wrong ID:** The app's project files were configured to use the ID of the empty "Faith Empire" app. This meant every time we built the app, it was being sent to the wrong, empty listing.
3. **The Correction:** I have now fixed this. I updated the project configuration ( `app.json` and `eas.json` ) to use the correct name ("Decoded Faith Empire") and the correct App Store ID ( `6759208291` ).

4. **Successful Rebuild:** After correcting the ID, I triggered a brand new build. This new build (**version 1.1.0, build 2**) is now complete, correct, and points to the right app listing.

| Status       | Detail                                                      |
|--------------|-------------------------------------------------------------|
| Bundle ID    | Corrected to <code>com.decodedfaithempire</code>            |
| App Store ID | Corrected to <code>6759208291</code> (Decoded Faith Empire) |
| New Build    | Version 1.1.0 (Build 2) is complete and valid               |
| Result       | The correct app binary ( <code>.ipa</code> file) is ready.  |

## What Needs to Be Done: The Upload

This is the final step and it's where we are right now.

- **The Goal:** Upload the correct build file to the correct app listing in App Store Connect.
- **The Problem:** The standard `eas submit` command, which normally handles this automatically, is stuck in a long queue on EAS's free tier. It's been waiting for a "submitter" for over 30 minutes. This is a common issue with the free service.
- **The Solution (In Progress):** To get around the queue, I am now using a more direct method. I am using the `eas submit --path` command, which uploads the build file directly from the local filesystem, bypassing the EAS queue. This is the most reliable way to get the build to Apple when the main queue is slow.

## Current Status

**The direct upload is running now.** It will deliver the correct, newly built `.ipa` file straight to your fully configured "Decoded Faith Empire" app listing in App Store Connect.

Once this upload completes, the app will appear in TestFlight and will be ready for you to click "Submit for Review" in App Store Connect. I will notify you the moment it is done.
